LAB 7: FUZZ TESTING FOR INPUT VALIDATION BUGS

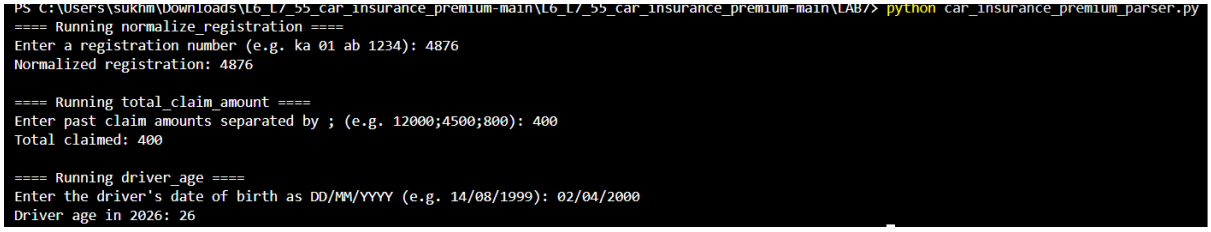

Car Insurance Premium Parser | Hypothesis and pytest

SUKHMEET KAUR

PES1UG24CS479

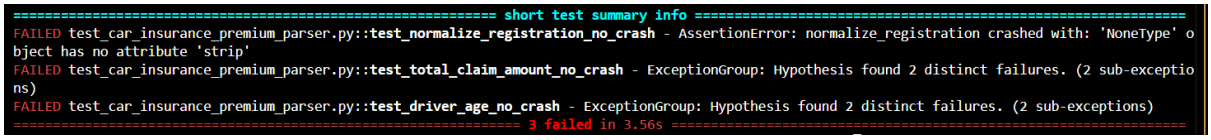

Screenshot 1 – Original Application Output

The original car insurance premium parser was executed before any fixes. The application accepted sample
registration, claim amount, and date-of-birth inputs

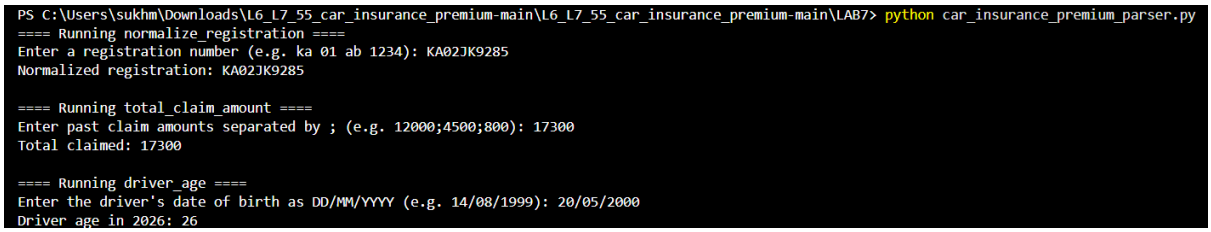

Screenshot 2 – Fuzz Testing Failures

The initial Hypothesis tests exposed failures in all three functions: registration normalization, total claim amount,
and driver age

Screenshot 3 – Fixed Application Output

The corrected application was executed with sample inputs to verify the updated functions.

Screenshot 4 – Successful Fuzz Testing

The final pytest run shows all three Hypothesis tests passing
